-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROTEIN TYROSINE PHOSPHATE.
-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                                                                                                                                                                                   CHARIFSON P.S., SHEWCHUK L.M., ROCQUE W., HUMMEL C.W., JORDAN S.F. -!- FUNCTION: THIS PHOSPHOPROTEIN, REQUIRED FOR BOTH THE INITIATION
AND THE MAINTENANCE OF NEOPHASTIC TRANSFORMATION, IS A PROTEIN KINASE THAT CATALYZES THE PHOSPHORYLATION OF TYROSINE RESIDUES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IN VITEO.

CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
SIMILARITY: CONTAINS 1 SH3 DOMAIN.
SIMILARITY: CONTAINS 1 SH3 DOMAIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AVIAN SARCOMA VIRUS (STRAIN PR2257).

"Conservation of structure and expression of the c-yes and fyn genes in lower vertebrates.";

ONCOGENE 6:361-386(1991).

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +

PROTEIN TYROSINE PHOSPHATE.

-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SUMMARIES

Εď	New nucleic acid encoding specific protein tyrosine phosphatases -
Τď	
ΡŢ	prevention of cancer and neurodegenerative disease
PS	Claim 2; Page 154-155; 193pp; English.
ပ္ပ	The present invention describes isolated, enriched or purified nucleic
ပ္ပ	acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The
8	present sequence represents human SAD. The above proteins, other than
<u> </u>	ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify
ပ္ပ	substances that modulate their activity (i.e. agonists and antagonists,
ပ္ပင္ပ	including NBP) in vivo or in vitro. These substances are used to treat
2	or prevent diseases associated with abnormal signal transduction
ပ္ပင္ပ	pathways that involve the proteins, particularly cancer (e.g. leukaemia
2 5	and lymphomal, while modulators of ALK-/ (which is a type I receptor

Claim 19; Fig 3A; 82pp; English.

Human megakaryocyte kinase MKK3 (R84183) is a 58 kDa cytosolic tyrosine kinase showing 47% homology with fyn. Recombinant MKK3 can be produced in host calls by expression of encoding cDNA (T00618), and used in the treatment and diagnosis of e.g. leukaemia and

Agonist antibodies which activate specific protein tyrosine kinase(s) - also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, cell growth and differentiation Disclosure; Pages 56-58; 125pp; English.

DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. A LpTK2 gene (T03097) was isolated from lymphocytic and megakaryocytic cell libraries. The encoded novel pTK, LpTK2 (R65929), shows homology to known pTKs, and can be used to design drugs that modulate pTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  116 wffgaigrsdaekgllysenktgsfliresesqkgefslsvldgavvkhyrikrldeggf 175

Claim 3; Fig 5; 60pp; English.

PTK genes were identified using two sets of degenerative oligonucleotide primers: a first set which amplifies all pTK DNA segments (Q4974-44), and a second set which amplifies highly conserved sequences present in the catalytic domain of the c-kit subgroup of pTKs (Q4974-66). The pTK genes identified are described in Q49747-57 and R41897-02.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The LpTKs are expressed in lymphocytic cells, as well as megakaryocytic cells. The partial and full-length LpTK2 gene sequences are given in Q49749 and Q49784 respectively. The protein sequence corresp. to Q49749 is claimed (claim 7) and stated as given in the specification, however is missing from the publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 260; DB 14; Length 505;

T. Feathert of autoimmune oisease and for T and B cell proliferation,
This sequence represents the B56-lck SH2 binding domain which is
Capable of binding the p62 sequences represented in W3182 and
Capable of binding the p62 sequences represented in W3182 and
W3183 in a phosphotyrosine (P7) independent manner. Such p62
CC Gapable of modulating T or B cell
CC Gativity. They are also capable of modulating degradation of Lck
CC activity. They are also capable of modulating expression of
CC cativity. They are also capable of modulating expression of
CC cativity. They are also babble of modulating expression of
CC cativity. They are this is benefit and arresting cell cycle
CC cativity. They are also benefit benefit and arresting cell cycle
CC protection at specific boundaries to thereby modulate cell
CC proliferation. As p62 acts to boost B cell response and may be used to
CC treat disorders where this is benefitial, e.g. infections pathogenic
CC expand T cell populations for treating infectious diseases or cancer,
CC expand T cell populations for treating infectious diseases or cancer,
CC e.g. the resulting cells may be transduced to render them resistant to
CH IV infection. Inhibitors of p62 can be used to reduce B or T cell
CC responses and may be used to treat a variety of autoimmune diseases, e.g.

                                                                                                                                                                                                                                                                         WPI; 96-372674/38.
Use of selective src SH2 domain ligand - to prepare medicament for treating bone resorption disease
Example 11; Page 28-29; 47pp; English.
Construct DET1-DET2-spacer-ek-1ck SH2 (W02120) was obtd. by
Inserting a PCR fragment (see also T36190-91) coding for human lck
SH2 domain into a vector contg. a tagged chicken src gene
DET1-DET2-spacer-SH2 (see also T36186-87). The construct can be
expressed in E. coli and used, together with similar constructs (see
also W02119-21 and W02124-27), in binding assays to determine the
specificity of cpds. to inhibit SH2 domains; cpds. that selectively
inhibit the human src SH2 domain are useful in treating bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W19624;

                                                                                                                                                                                                                                                                                                                                            Enhancing erythropolesis with specific activator of human Stat 5 SH2 domain - has very low binding affinity to other SH2 domains so free domain - has very low binding affinity to other SH2 domains so free cost side effects, particularly for treating anemia Example 11; Page 54-55; 91pp; English.

W19624 is a fusion protein of formula DET1-DET2-Sp-ek-SH2, where DET1 is a defined epitope tag from HIV-1 gpl20, DET2 is a hexalistidine sequence tag (binds to nickel-containing resins, used for purification). Sp is a spacer, ek is an enterokinase protease recognition site and SH2 is the human lck SH2 domain. DET1 is included so that antibodies against the epitope can be used to detect the recombinant expression of the fusion protein and hence the SH2 domain. The fusion proteins are used for identifying compounds that bind the SH2 domain causing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 3; Page 28-29; 46pp; English.

This sequence represents the DETI-DETI-spacer-ek-lck SH2 construct encoded by the sequence amplified by the primers given in T37297-98. This protein fragment was used in the isolation of a compound for improving erythropoiesis. The compound may be used for the treatment of anamaia or to enhance haematopoiesis. The isolated compound antagonises the hcp SH2 domain without side effects caused by non-specific inhibition of other SH2 domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  31 wffknlsrkdaerqllapgnthgsfliresestagsfslsvrdfdqnqgevvkhykirnl 90
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of selective antagonist of haematopoietic acid phosphatase SH2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 domain - with no significant affinity for other SH2 domains, to increase erythropoiesis and haematopoiesis, esp. for treatment of

Wil285-Wil288 represent fusion proteins containing Src homology 2 (SH2)

Wil285-Wil288 represent fusion proteins containing Src homology 2 (SH2)

Comains. These sequences are used to identify a compound that targets the human Stat (signal transduction and activation of transcription) 6 SH2

Commain. The identified compound activation of transcription) 6 SH2

Compound has an affinity for the human Stat5

SH2 GM2 SH2, Src SH2, Ick SH2 or Fyn SH2 of more than 50 (preferably 100) times lower than its affinity for hcg SH2, SH-PPP2 SH2, p85

COMPOUND SH2, Src SH2, Ick SH2 or Fyn SH2 of more than 50 (preferably 100) times lower than its affinity for Stat 6 SH2. SH2 domains are conserved non-catalytic sequences found in a variety of signaling molecules, such as non-receptor protein tyrosine kinases, and in occopanic proteins. The compounds identified using the fusion proteins

Comcogenic proteins. The compounds identified using the fusion proteins are used as the administered compound in the method of the invention for treating allergic reactions. Administration of the compound avoids the side effects (e.g. reduced erythrocyte production) associated with consecution inhibition of SH2 domains rather than all 60 known domains. Companies are be used for the treatment of asthma and allergic rhintits, but can also be used to treat atopic dermatitis. Inhibition of the human companies in terleuxin-4 (iL-4) or IL-13.
                                                                                                                                                                                                                                                                                                                                           DET.-DET2-spacer-ek-lck SH2 fusion protein.

DET1-DET2-spacer-ek-lck SH2 fusion protein.

A brk (breast tumor kinase) cDNA fragment was used to screen a cDNA library prepared from human breast tumor cell line T-47D. 2 cDNAs were isolated. The silghtly longer clone lambda-t2 (Q8189) encoded brk (R63088), which was identified as a novel putative non-receptor kinase of use as a prognostic/diagnostic of breast
                                                                                                                                                                                                                                                                                                                                                           /note= "potential regulatory tyrosine equivalent to Tyr-527 of c-src"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel protein tyrosine kinase and its DNA - isolated from huma breast tumour, useful for diagnosis and prognosis of cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5

in the treatment of e.g. cancer, or for targetting specific SH2 domains in the treatment of e.g. cancer. Or for targetting specific SH2 domains for diagnostics. The modified Src SH2 domain is useful as a research tool to study signal transduction in general and for a variety of applications such as diagnostics, therapeutics, and drug design. It detects aberrant phosphorylation events including those associated with tumnour progression of breast and ovarian carcinomas for tumnour to treat disorders resulting from aberrant signal transduction pathways to treat disorders resulting from aberrant signal transduction pathways to treat associated by the signal transduction protein prevents further transmission of the signal transduction protein prevents curve binds to an aberrant signal transduction protein thereby blocking the binding of the wild type SH2 domains, or inactivates the phosphorylated signal transduction protein by removing a phosphate group. This sequence is not given in the specification, but is created using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosis and staging. It interferes with signal transduction pathways to treat disorders resulting from aberrant signal transduction pathways such as cancer, autoimmune disease, and allergies. Interference with the signal generated by the signal transduction protein prevents further transmission of the signal to other components of the cell. It also binds to an aberrant signal transduction protein thereby blocking the binding of the wild type SH2 domains, or inactivates the phosphorylated signal transduction protein by removing a phosphate group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W59756 standard; peptide; 98 AA.

Amino acid sequence of the SH2 domain src mutant M3.
SH2 domain; signal transduction protein; cancer; SH2 domain src; tumour; phosphorylation; breast cancer; ovarian cancer; autoimmune disease;
                                                                                                                                                    148 wyfgkitrreserllInpenprgtflvresettkgayclsvsdfdnakglnvkhykirkl 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetically engineered endothelial cells - which exhibit enhanced cell migration, urokinase-type plasminogen activator activity, and reduced mononuclear cell adhesion and fibronectin prodn bisclosure; Page 64-66; 91pp; English.

The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in Q46687) is used to transform endothelial have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angloplasty, heart bypass surgery, vessel graft and stent
                                                                                                                  1 wyfgkitrreserlllnpenprgtflvresettkgayclsvsdfdnakglnvkhykirkl 60

Parameter of for transduction proteins - useful for modified SH2 domains of intracellular proteins - useful for modified SH2 domains of intracellular proteins in the treatment of e.g. rancer, or for targetting specific SH2 domains for diagnostics cancer, or for targetting specific SH2 domains for diagnostics. The method of the invention to inactivate signal transduction proteins to the method of the invention to inactivate signal transduction proteins in the treatment of e.g. cancer, or for targetting specific SH2 domains of for diagnostics. The modified Src SH2 domain is useful as a research tool to study signal transduction in general and for a variety of applications such as diagnostics, therapeutics, and drug design. It capplications such as diagnostics, therapeutics, and drug design. It capplications such as diagnostics, therapeutics, and drug design. It capplications are aberrant phosphorylation events including those associated with tumour progression of breast and ovarian carcinomas for tumour cumour progression of breast and ovarian carcinomas for tumour cumour progression of breast and ovarian carcinomas for tumour cumour progression of breast and ovarian tansduction protein prevents such as cancer, autoimmune disease, and allocation protein thereby blocking the binding of the wild type SH2 domains, or inactivates the call of the wild type SH2 domains, or inactivates the phosphorylated signal transduction protein by removing a phosphate group. This sequence is not given in the specification, but is created using Sequence 18 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
PROTEIN TYROSINE PHOSPHATE.

-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.

-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
                                                                                                                                                      EUKARYOTA; METAZOA; CHORDATA; VERTEBRATA; MAMMALIA; EUTHERIA; ROBENTIA; SCIUROGNATHI; MURIDAE; MURINAE; MUS.

INT. J. CANCER 54:571-577(1933).

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +

PROTEIN TYROSINE PHOSPHATE.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

-!- TISSUE SPECIFICITY: RESTRICTED TO CELLS LINES DERIVED FROM TISSUES

OF LYMPHOID, BRAIN, BREAST, COLON AND BLADDER ORIGIN.

-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC

-!- SIMILARITY: CONTAINS I SH2 DOMAIN.

-!- SIMILARITY: CONTAINS I SH3 DOMAIN.

"Nucleotide sequences of the Drosophila src and abl homologs:
conservation and variability in the src family oncogenes.";
CELL 35:393-401(1983).

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                    SUBMITTED (MAY-1997) TO THE PDB DATA BANK.
-!- FUNCTION: THIS PHOSPHOPROTEIN, REQUIRED FOR BOTH THE INITIATION AND THE MAINTENANCE OF NEOPLASTIC TRANSFORMATION, IS A PROTEIN KINASE THAT CATALYZES THE PHOSPHORYLATION OF TYROSINE RESIDUES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
SIMILARITY: CONTAINS 1 SH2 DOMAIN.
SIMILARITY: CONTAINS 1 SH3 DOMAIN.
SIMILARITY: TO OTHER PROTEIN TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                       AVIÀN SARCOMA VIRUS (STRAIN PR2257).
VIRUSES: RETROID VIRUSES; RETROVIRIDAE; AVIAN TYPE C RETROVIRUSES.
                                                                                                                                                                                    GERYK J., DEZELEE P., BARNIER J.V., SVOBODA J., NEHYBA J.,
